

CPM Precedence Method (Contract Dates; Milestones; Schedule Updating)

Construction Project Management

2013. 4.2.
Hyoungkwan Kim, PhD, PEng
Yonsei University

Interfering Float (IF)

- The amount of time that allow an activity to be delayed without affecting the completion date of the project but will affect its immediate successors.

Interfering Float = Total Float – Free Float

- $TF_A = 5$
- $FF_A = 0$
- $IF_A = TF_A - FF_A = 5$

Independent Float (INDF)

- The amount of time delay that can occur to an activity without affecting subsequent activities or restricting the preceding activities

(Finish to Start Relationship)

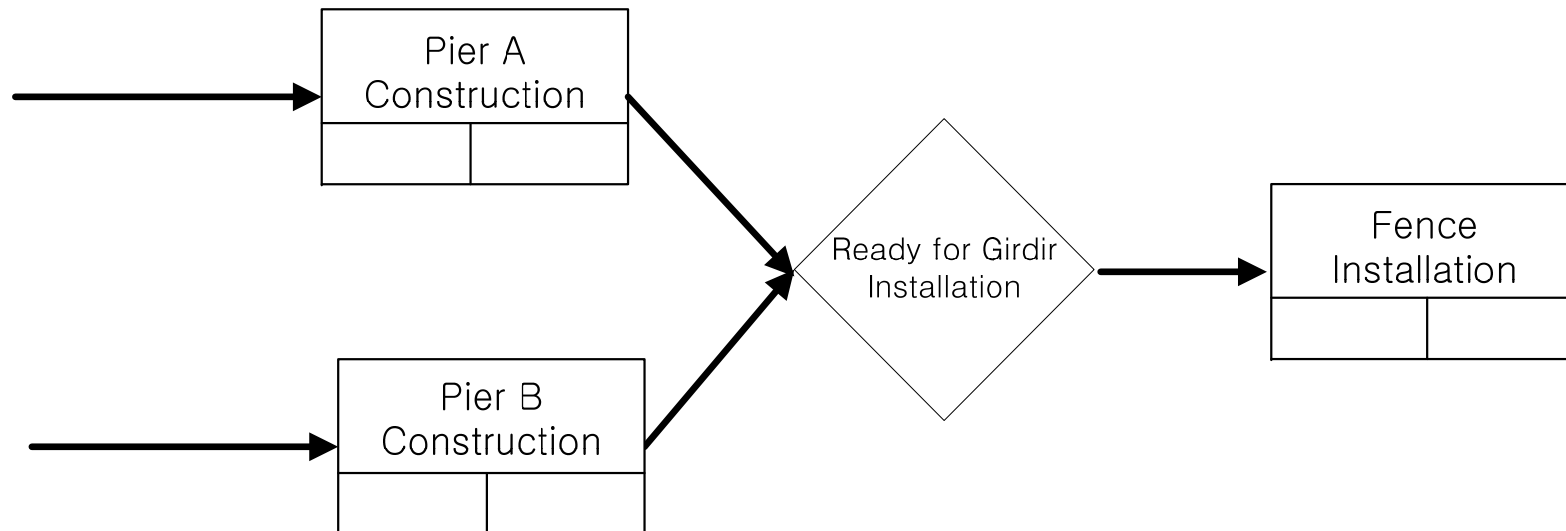

$$\text{INDF (Y)} = \text{ES (Z)} - \text{LF (X)} - \text{Duration (Y)}$$

- $$\text{INDF}_B = \text{ES}_C - \text{LF}_A - \text{Duration}_B$$
$$= 55 - 50 - 12 = -7 \rightarrow 0$$

Milestone

- Milestone is an event of major significance representing an important intermediate goal
- An event is a single point in time that can be represented by an activity with zero duration
- Milestone is used
 - to signify the end of a certain phase or group of activities
 - to inform that the project is now ready to move to the next phase
 - as a contractual requirement

Contract Dates (Scheduled Dates, Plug Dates, Imposed Dates, and Artificial Constraints to Dates)

- Dates specified in the contract, to control start or finish dates of activities
- Contract dates can affect the computation of early and finish times of activities in the CPM network
- Contract dates can be used to ensure that important activities can be executed as planned
- Contract dates imposed on a project can disrupt the natural logic of CPM network
- Contract dates can be placed on activities or events

Early Constraints of Contract Dates

- “Not Earlier Than” Date
 - The activity (or the event) can occur on the specified date or later
 - A notation example:

Apr. 2, 3, 4 ... are Yes,
otherwise No

- Early Start Constraint for an activity in Primavera: “Not Earlier Than” date imposed on the activity start

Activity A can start on day
3, 4, 5 ...

but not on day ... 1, 2

Early Constraints of Contract Dates (cont'd)

- “Not Earlier Than” Date (cont'd)
 - Early Finish Constraint for an activity in Primavera:
“Not Earlier Than” date imposed on the activity finish

Activity A can finish on day
3, 4, 5 ...
but not on day ... 1, 2

- Early Start Constraint is also called Start Not Earlier Than Constraint
- Early Finish Constraint is also called Finish Not Earlier Than Constraint

Late Constraints of Contract Dates

- “Not Later Than” Date

- The activity (or the event) can occur on the specified date or earlier

- A notation example:

... Mar. 31, Apr. 1, 2 are Yes,
otherwise No

- Late Start Constraint for an activity in Primavera: “Not Later Than” date imposed on the activity start

Activity A can start on day
... 1, 2, 3

but not on day 4, 5, 6 ...

Late Constraints of Contract Dates (cont'd)

- “Not Later Than” Date (cont'd)
 - Late Finish Constraint for an activity in Primavera: “Not Later Than” date imposed on the activity finish

Activity A can finish on day
... 1, 2, 3
but not on day 4, 5, 6 ...

- Late Start Constraint is also called Start Not Later Than Constraint
- Late Finish Constraint is also called Finish Not Later Than Constraint

Mandatory Constraints of Contract Dates

- “Not Later and Not Earlier Than” Date
 - Aka “Absolutely Required Date;” the activity (or the event) can occur only on the specified date
 - A notation example:

Apr. 2 is Yes,
otherwise No

- Mandatory Start Constraint for an activity in Primavera:
“Not Later and Not Earlier Than” date imposed on the activity start

Activity A can start only on day 3
but not on other days

Mandatory Constraints of Contract Dates (cont'd)

- “Not Later and Not Earlier Than” Date (cont'd)
 - Mandatory Finish Constraint for an activity in Primavera: “Not Later and Not Earlier Than” date imposed on the activity finish

Activity A can finish only on day 3
but not on other days

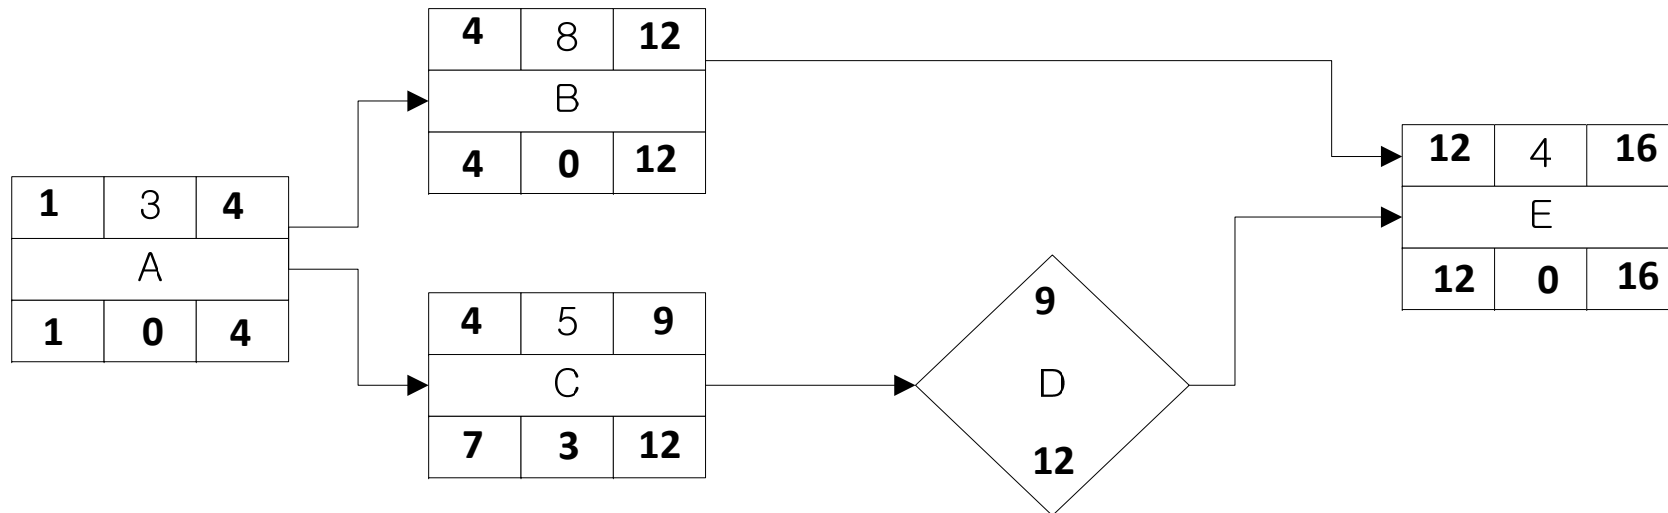

Contract Dates on Milestones

- “Not Earlier Than” Date
 - Milestone A can occur on day 9, 10, 11 ...
 - But not on day ... 6, 7, 8
- “Not Later Than” Date
 - Milestone A can occur on day ... 7, 8, 9
 - But not on day 10, 11, 12 ...
- “Not Later and Not Earlier Than” Date
 - Milestone A can occur only on day 9

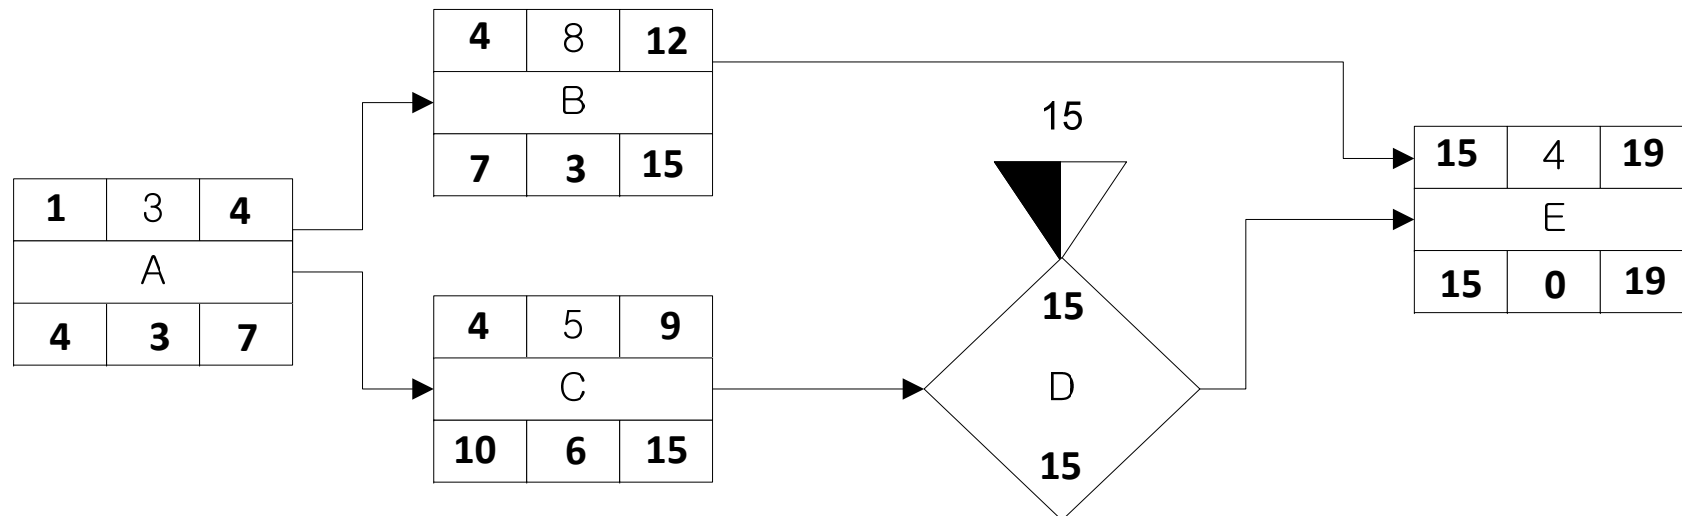

CPM Example without Contract Dates

Early Start	Duration	Early Finish
Task Name		
Late Start	Total Float	Late Finish

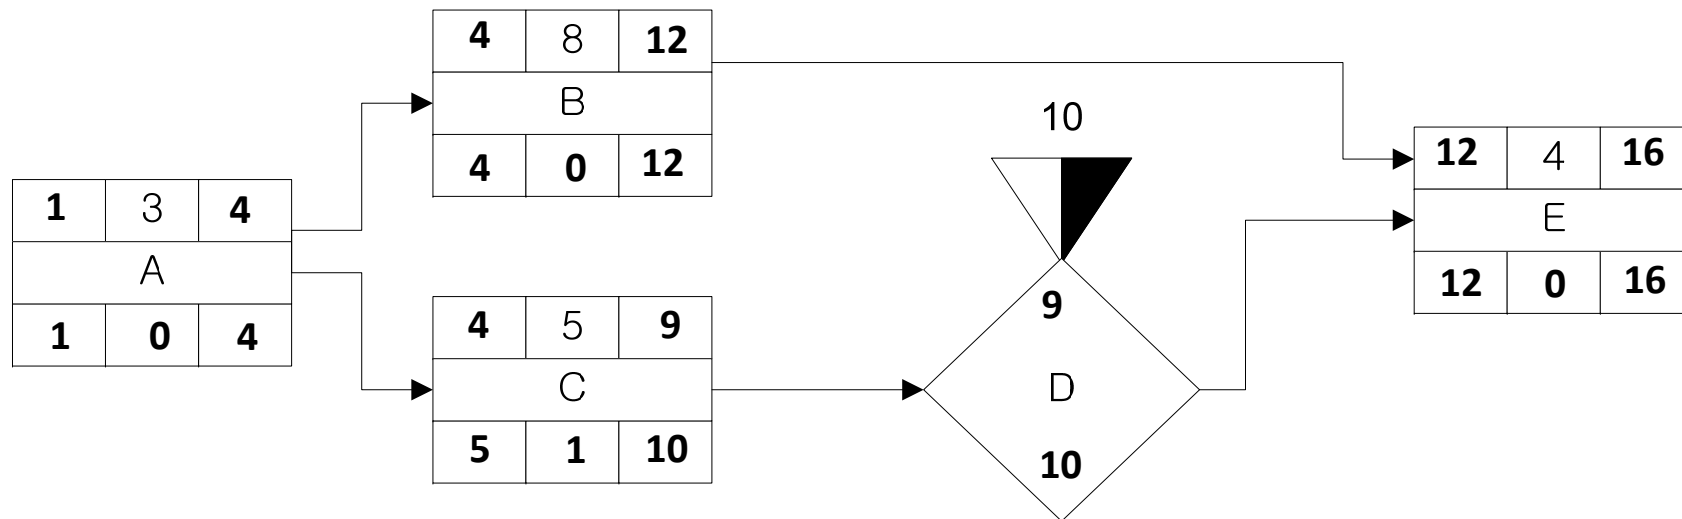

“Not Earlier Than” Date Impact

Early Start	Duration	Early Finish
Task Name		
Late Start	Total Float	Late Finish

“Not Later Than” Date Impact

Early Start	Duration	Early Finish
Task Name		
Late Start	Total Float	Late Finish

“Not Later and Not Earlier Than” Date (Absolutely Required Date) Impact

Early Start	Duration	Early Finish
Task Name		
Late Start	Total Float	Late Finish

Milestones in Scheduling Software

(under the Assumption of 8 Working Hours Per Day)

- There are two types of milestones in Primavera

- Start milestone

- Only start constraints (early start constraint or late start constraint) can be applied
- The times of the milestone is associated with the successor

- Finish milestone:

- Only finish constraints (early finish constraint or late finish constraint) can be applied
- The times of the milestone is associated with the predecessor

CPM Computation with Contract Dates

Early Start	Duration	Early Finish
Task Name		
Late Start	Total Float	Late Finish

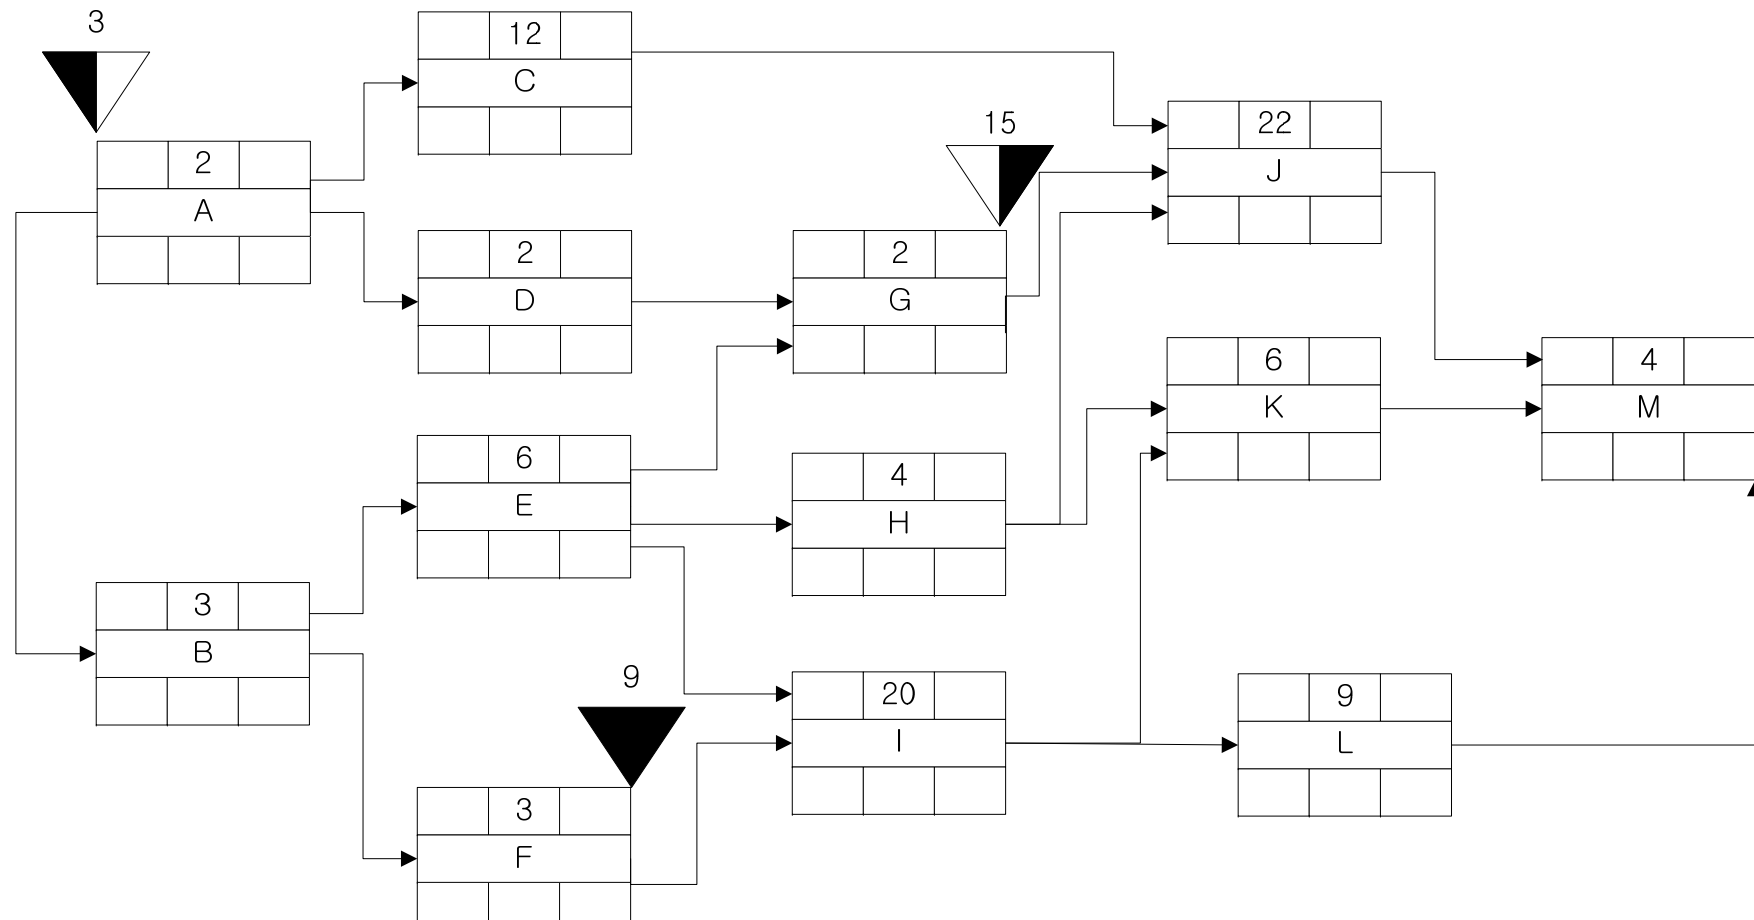

"Not Earlier Than"
Date

"Not Later Than"
Date

Absolutely Required
Date

Schedule Update

- What would you do if the CPM network turns out to be unrealistic?
 1. Throw it to the garbage basket
 2. Put it in a frame and hang it on the wall
 3. Update it and keep using it
- During construction, new and more accurate project information becomes available
 - Accurate or actual amount of times required for activities
 - Accurate or actual amount of resources required for activities
 - Accurate or actual amount of money required for resources
 - Accurate or actual logical relationships among activities
 - New or deleted activities
 - In-progress activities with remaining duration
 - finished activities
 - ...

Schedule Update (cont'd)

- The new and more accurate project information should be reflected on the original plan
- The revised plan can inform the users of the best way to use the resources; the project manager can make better informed decisions
- The CPM network is updated based on the most up-to-date information
 - On a regular basis, the new information is collected from the site mostly or from other sources
 - The date at which the CPM network is updated is called Data Date
 - Date Date is the new start date for the remaining part of the project
- The project should be carefully monitored using the schedule updating process to ensure the timely completion of the project

CPM Computation Example for Schedule Update
